Summary

Computational scientist with 10+ years of experience turning experimental data into reliable, decision-ready insights, now looking to integrate more structure-function relationships into diagnostics and drug discovery. I partner with lab scientists to optimize assays, diagnose unexpected results, and benchmark models to determine which are predictive in which contexts. I build reproducible production pipelines and structured databases from scratch for scalable analysis. I have applied these skills to variant interpretation in rare disease and oncology diagnostics, and to prioritizing antibodies for drug candidates using machine learning and structure-to-function models with NGS data. I'm focused on linking structure, function, and other modalities with preclinical and clinical data to connect variants to their biological and patient impact.

Experience

Senior Bioinformatics Engineer - Metaphore Biotechnologies (Flagship Pioneering) March 2025–Present

- Proposed bispecific antibody candidatres by exploring the antibody properites (eg. sequence similarity, developability) from high-throughput screening campaign .
- Designed and diagnosed issues in antibody screening and maturation (Deep Mutational Scanning) pipelines, reducing turnaround time and improving reproducibility so scientists could iterate faster across discovery campaigns.
- Validated assay performance by building an Athena analytics layer on the LIMS data lake to validate assay performance and surface experimental trends, making data accessible across campaigns for reanalysis and quality assessment.
- Evaluated embedding-based vs sequence-similarity approaches for candidate prioritization by building a pipeline to cluster 2B antibody sequences (MMseqs2) and benchmarking against PLM embeddings (ESMC, FlashAb, AbLang), validating which analytical approach best supports candidate prioritization across 3 programs.
- Built interactive dashboards with an LLM-powered exploration component (Claude API), enabling scientists without coding experience to independently filter and customize UMAP embedding plots via natural-language requests, with safeguards against unintended data mutation thus allowing scientists to explore their data for patterns to uncover hidden relationships.
- Delivered quarterly project updates and technical/strategic insights in company-wide presentations.

Senior Bioinformatics Scientist - Natera Feb 2022–August 2024

- Integrated tumor DNA and RNA data (VAF, clonality, expression, RNA variant support) with HLA binding predictions to rank and select neoantigen peptides for personalized cancer vaccine candidates.
- Partnered with lab scientists to optimize RNA-seq assay performance for detecting oncogenic fusions in noisy FFPE tumor samples, diagnosing unexpected results and improving assay sensitivity and specificity.
- Built scalable, cloud-native pipelines that reduced turnaround time for WES and RNA-seq QC analyses by 40%, enabling faster iteration on assay development.
- Developed an integrated classifier to identify pathogenic genetic variants by combining population genetics, functional annotations, machine learning-based predictors (e.g., AlphaFold, REVEL), and curated clinical metadata.

Bioinformatics Scientist - Fabric Genomics (acquired by GeneDx) Nov 2019–Jan 2022

- Maintained and enhanced the ACE algorithm, a production-grade tool for prioritizing clinically pathogenic variants, by implementing comprehensive regression and unit testing to ensure reliability and compliance in a regulated environment.
- Enhanced variant prediction classifiers to increase precision in identifying likely pathogenic variants and flagging borderline cases for use by CAP/CLIA regulated labs using statistics and machine learning.
- Utilized clinical ontologies (HPO, SNOMED, ICD-9/10) to map patient symptoms to structured phenotypes and prioritize candidate variants for rare disease diagnosis and clinical interpretation.
- Leveraged distributed computing frameworks like Apache Spark to scale data classification workflows and optimize ETL processes, streamlining data analysis pipelines for large-scale datasets.
- Actively participated in code reviews, planning sessions, and best practices discussions, fostering a collaborative and high-quality development environment.

Skills

Programming Languages: Python, R, SQL

Data Science: Pandas, NumPy, Scikit-learn, DuckDB, Polars, PyTorch, Matplotlib, Streamlit, GGplot2, Bioconductor, RShiny

Computational Resources: High Performance Cluster, AWS (S3, EC2, Batch, Athena), Google Cloud Compute, Kubernetes, Docker, Argo, WDL, Nextflow, Prefect, Git, SQL (MySQL, Spark), noSQL (MongoDB, DynamoDB), Neo4j, MCP, LangChain

Statistics and Machine Learning: Hypothesis Testing, Linear and Generalized Linear Modeling, Multivariate Modeling, Clustering, Dimensionality Reduction, Supervised and Unsupervised Classification, Random Forests, HMM, Kaplan-Meier

Education

University of California, San Francisco **Ph.D. Bioinformatics**

Statistics and machine learning to identify enhancers (epigenetics) and genes predictive of tissue developmental phenotypes.

University of California, Los Angeles **B.S. Biochemistry**
